

binni Concrete: Configuring App in Procore

Welcome to binni! Here is a guide for how to set up the binni Concrete app in the Procore environment. The binni application will need to be configured for each project in Procore.

1. In your Procore Portfolio of projects, select the project you wish to utilize binni Concrete with.
2. In the menu bar at the top of the screen, select Apps :: App Management
3. Find binni Concrete in the list of Apps and select View
4. Select Configurations and then click Create Configuration
5. Choose the project for which you are configuring binni Concrete
6. Input a Title of your choosing (we recommend using a nomenclature that identifies which project the configuration is for)

The information for the next two fields in the configuration, Project ID and Platform ID, can be found in binni. In your browser or binni app, login into binni and navigate to the project. Once in the project, follow the following steps to find the Project ID and Platform ID:

7. At the top right of the screen, click on the green icon with two arrows (see Figure 1 below)

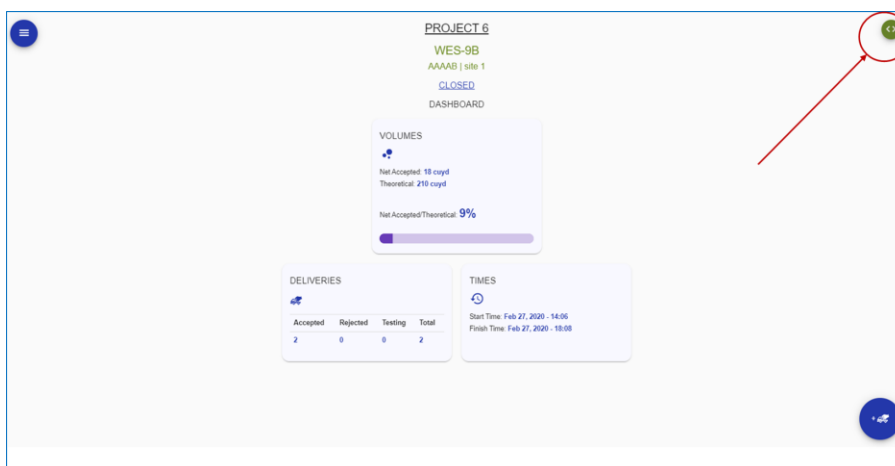

Figure 1

8. Once you click the button the REST API ID numbers will be displayed – see Figure 2.

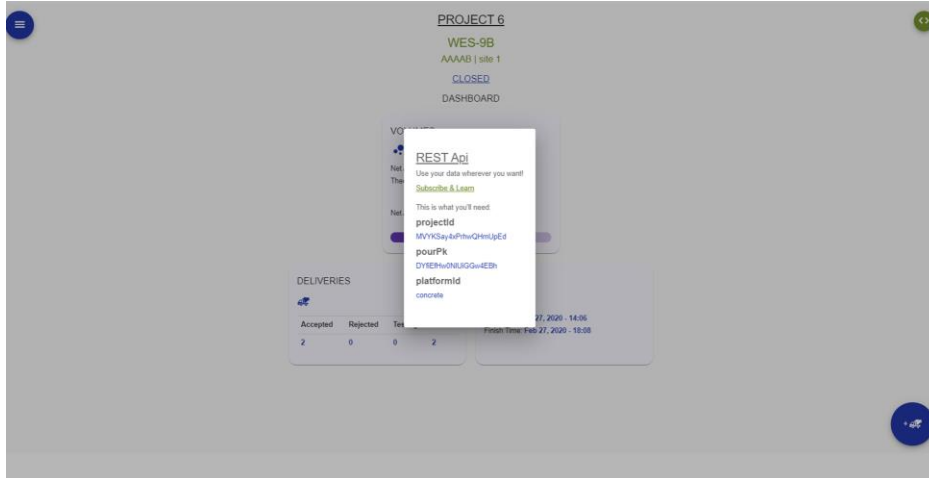

Figure 2

9. Copy and paste the Project ID and the Platform ID into the Procore configurable fields.

You are all set! The binni Concrete app is now configured and you can quickly and easily access your concrete placements in the binni platform through your project in Procore.

For more information or assistance, please email us at support@binni.co.

Happy Building!

The binni Team
